1. The drawings are objected to because fig 2 box 8 is not labeled descriptively. Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as “amended.” If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either “Replacement Sheet” or “New Sheet” pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.
2. The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the three or four motors must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate

4. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

5. Claims 1 and 3 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Recitation "such that a predetermined rotational stiffness for supporting said payload is achieved" is an end result. What structure or steps achieve this result?

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and

the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. Claims 1-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over 6038013 as cited by applicant in view of Cox et al.

6038013 discloses controlling motors 7a-7d , actuating a payload , the payload ad having a center of gravity, see col 6 lines 60-col 7 lines 23 and fig 1 , control arrangement comprising controller for receiving height signals from sensors 10z1-10z3 , sensing heights of payload and for calculating control signals for motors from said height signals , col 11 line 62-col 12 line 14, co l 13 , liens 30-37 and fig 5 , wherein controller is arranged to calculate from these height signals at least one angle of rotation of center of gravity about a horizontal axis , co l13 lines 38-45, and calculate from this at least one angle of rotation said control signals for motors such that predetermined rotational stiffness for supporting payload is achieved, see col 14 liens 19-29 and col 14 lines 36-41 . 6038013 lack disclosing Lorenz motors. Cox et al discloses Lorenz motors, see col 8 lines 45-65. It would have been obvious to one of ordinary skill in the art to combine the control of 6038013 with Lorenz motors of Cox et al for improved control.
